Section 8. Project description

a. Technical and/or scientific background

(Replace this text with your response in paragraph form)

b. Rationale and significance to Regional Programs

The Deschutes River Subbasin in north-central Oregon is the second largest watershed in the state, covering approximately 10,500 square miles. The Deschutes River flows north through central Oregon and enters the Columbia River 205 miles from the Pacific Ocean.

About 62 percent of the land is privately owned; federal ownership (U.S. Forest Service and Bureau of Land Management) accounts for 15 percent; and 21 percent are Tribal lands (Confederated Tribes of the Warm Springs Reservation). Forestry, timber production, grazing and agriculture (dry land farming) are major land uses. Portland General Electric's Pelton-Round Butte project and the Warm Springs Tribes' Pelton Reregulating Dam are the only hydroelectric facilities. Northern Wasco County People's Utility District has applied for a permit to develop a hydropower project at White River Falls.

The anadromous fish species most actively targeted for management in the Deschutes Subbasin are native spring chinook and summer steelhead. Summer/fall chinook are managed for wild production, and a small remnant run of sockeye persists. Pacific lamprey are also a species of concern in the Deschutes River. The goal for these species is to restore sustainable, naturally producing populations to support tribal and

non-tribal harvest and cultural economic practices while protecting the biological integrity and the genetic diversity of the watershed.

Anadromous fish populations are depressed due primarily to the impacts of mainstem Columbia and Deschutes dam construction, out-of-subbasin harvest, instream and riparian habitat degradation, water quality and quantity reductions and potential genetic impacts to wild stocks from release of out-of-subbasin hatchery fish. Riparian areas on tributaries are degraded from overgrazing, and low juvenile survival in east side tributaries is caused by low stream flows and high water temperatures from water withdrawals for irrigation and degradation of riparian habitat from overgrazing. Round Butte and Pelton dams, constructed in 1958 and 1964 (respectively) have eliminated spawning and rearing habitat for spring chinook, sockeye, and summer steelhead. Juvenile fish are also lost at unscreened irrigation diversions.

c. Relationships to other projects

Project #9404200 funds the operations and maintenance for the Trout Creek Habitat Improvement Project which started in 1982 and targeted steelhead. The Trout Creek watershed is fully screened (41 diversions), and maintenance of the screens is funded under #9306600 (cost shared with Mitchell Act funds. Watershed enhancement activities on the reservation will be funded under project #9138 in conjunction with activities funded by CTWSRO, BIA, NRCS and other entities. Project #9005 will provide start-up funds for riparian restoration and enhancement projects and for working with private landowners and resource managers to improve livestock management and reduce the impacts on riparian vegetation. Push-up dams will be consolidated by constructing cement diversions and/or infiltration sump/pump systems. Project #9007 (Middle Deschutes Watershed Coordinator) will coordinate with the Willow Creek & Trout Creek Watershed Councils to complete watershed assessments and develop goals, objectives, priority lists, action plans and a work plan to actively seek funding for on-the-ground projects in both watersheds. Project #9133 will initiate riparian work as the second phase of a comprehensive watershed treatment approach, and will construct 1.5 miles of riparian exclosure fencing as a demonstration project.

Projects funded by PGE (under FERC license conditions) and USFWS (under BPA MOA-Reimbursables) cover the cost of hatchery production for the Deschutes River Subbasin. ODFW and CTWSRO have instituted "catch and release" harvest regulations on naturally produced salmon and steelhead. Acclimation and release locations allow directed harvest of hatchery produced fish. Hatchery fish are not allowed above the Warm Springs National Fish Hatchery in order to protect wild spring chinook and steelhead; and no hatchery production of summer/fall chinook occurs to protect those wild stocks.

Over the past several years, fencing has excluded livestock from the lower 25 miles of the mainstem Deschutes. Grazing management protects the upper 40 miles.

d. Project history (for ongoing projects)

(Replace this text with your response in paragraph form)

e. Proposal objectives

The co-managers have adopted the following outcome-based objectives to address these problems: 1) improve the quantity and quality of aquatic and riparian habitat; 2) maintain and improve upland watershed conditions to sustain high water quality; 3) maintain the genetic diversity, adaptiveness, and abundance of the indigenous wild fish; 4) provide opportunities to harvest anadromous species, while maintaining adequate wild spawning escapement and hatchery broodstock; and, 5) increase harvest opportunity for hatchery-origin summer steelhead and spring chinook through the use of acclimation and adult capture facilities.

The co-managers have defined the following strategies to help achieve the objectives. These strategies include improving habitat through the use of riparian fencing, grazing management and instream structures; improving screens on irrigation diversions; and increasing harvest opportunities for tribal and non-tribal fisheries using artificial production while maintaining the genetic integrity of the wild fish by not allowing hatchery fish above the hatcheries.
